Project Maintenance

If you need to exit the GUI (which automatically opens) and access the main Raspberry Pi for any reason, you can close the application using a special combination. Select the button for “POWER DOWN?” and then select “NO”. Select “POWER DOWN?” and then “NO” again, and then repeat the process for a third time. After three cycles, the application will close and you will be returned to the desktop.

Alternatively, to close the application you would need to plug a physical keyboard into the Raspberry Pi and press the “Esc” key.

Once on the desktop, you can enable the onscreen keyboard by tapping on the Raspberry icon in the top-left corner, tapping “Accessories” and then “Keyboard”. Alternatively, you can click the shortcut in the taskbar.

The main project is stored in `/home/pi/Documents/CheckMate2.0/`. To run and debug the application *with* a terminal, you can navigate to this folder and then run `sudo python3 GUI.py`. It may be helpful to edit “GUI.py” and comment out `Config.set('graphics', 'fullscreen', 'auto')` to open the app in a smaller, resizable window.
